

Efficient Inference for Multinomial Mixed Membership Models

David Mimno
UMass, Amherst

Summary

- How **fast** can we make Gibbs sampling?
- How little **memory** can we use?

Goal: small collections should be fast,
large collections should be possible

Big collections! Lots of topics!

The image shows two screenshots side-by-side. On the left is the PubMed website, featuring a search bar at the top and a main content area with sections for "Using PubMed" and "PubMed Tools". On the right is the Wikipedia homepage, showing language versions in various languages like English, German, French, and Spanish, along with a search bar and a footer with language links.

PubMed

PubMed comprises more than 19 million MEDLINE, life science journals, and online full-text content from PubMed Central and other sources.

Using PubMed

- PubMed Quick Start Guide
- Full Text Articles
- PubMed FAQs
- PubMed Tutorials
- New and Noteworthy

PubMed Tools

- Single Citation Matcher
- Batch Citation Matcher
- Clinical Queries
- Topic-Specific Queries

|--------|---|
| dog | 0 |
| dog | 0 |
| horse | 1 |
| equine | 1 |

Sample

$\leftarrow u = \text{rand()} * Z$

Return t=0

For each token,

Doc A

| | |
|--------|---|
| dog | 0 |
| cat | |
| feline | 2 |
| hound | 0 |

for each possible topic [0, 1, 2],

Doc B

| | |
|--------|---|
| dog | 0 |
| dog | 0 |
| horse | 1 |
| equine | 1 |

Summary so far

- For every token,
 - For each possible topic t calculate $\text{score}(t \mid \dots)$
- Add up scores to **normalizing constant**

$$Z = \sum_t \text{score}(t)$$

- Sample $u \sim U(0, Z)$ and return the corresponding topic t .

Performance is dominated by calculation of Z

The normalizing constant

$$Z = \sum_t \frac{N_{t|d} + \alpha}{N_d + T\alpha} \times \frac{N_{w|t} + \beta}{N_t + V\beta}$$

The normalizing constant

$$Z = \sum_t \frac{(N_{t|d} + \alpha)(N_{w|t} + \beta)}{N_t + V\beta}$$

The normalizing constant

$$Z = \sum_t \frac{N_{t|d} N_{w|t} + \beta N_{t|d} + \alpha N_{w|t} + \alpha\beta}{N_t + V\beta}$$

The normalizing constant

$$Z = \sum_t \frac{N_w|t(N_{t|d} + \alpha)}{N_t + V\beta} + \sum_t \frac{\beta N_{t|d}}{N_t + V\beta} + \sum_t \frac{\alpha\beta}{N_t + V\beta}$$

The normalizing constant

$$Z = \sum_t \frac{N_w|t(N_{t|d} + \alpha)}{N_t + V\beta} + \sum_t \frac{\beta N_{t|d}}{N_t + V\beta} + \sum_t \frac{\alpha\beta}{N_t + V\beta}$$

↑
Document-specific

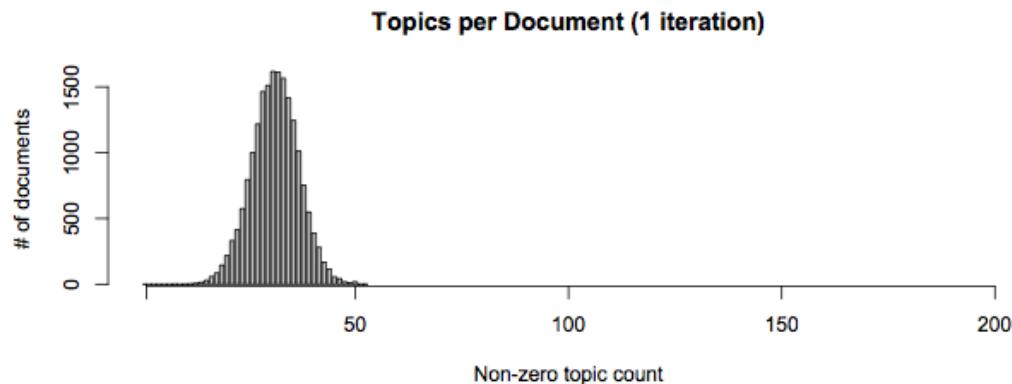

Token-specific

Independent
of word and
document

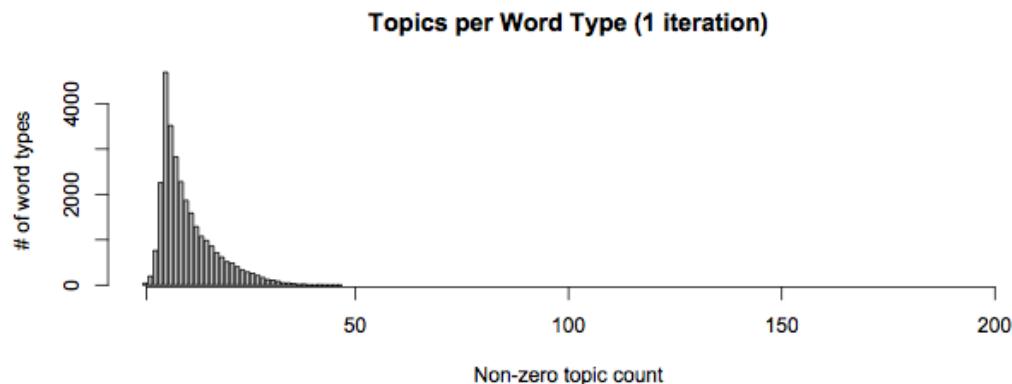

The normalizing constant

$$Z = \sum_{\substack{t: N_{w|t} > 0}} \frac{N_w|t(N_t|d + \alpha)}{N_t + V\beta} +$$
$$\sum_{\substack{t: N_t|d > 0}} \frac{\beta N_t|d}{N_t + V\beta} + \sum_t \frac{\alpha\beta}{N_t + V\beta}$$

Statistics are sparse

- $N_{t|d}$: 10-20%
- mostly zeros

- $N_{w|t}$: < 5%
- almost all zeros

Add up the scores

| equine | 1 |

Add up *some* blocks, cache others

Doc A

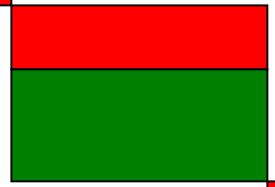

| | |
|--------|---|
| dog | 2 |
| cat | 2 |
| feline | 2 |
| hound | 0 |

Doc B

| | |
|--------|---|
| dog | 0 |
| dog | 0 |
| horse | 1 |
| equine | 1 |

Worst case: we might have to loop over all topics

Summary so far

- We can store most of the computation to calculate Z from token to token.
- We can sample exactly from the same distribution, with a new map from $(0, Z)$ to topics.

Fast iteration over $\{t : N_{w|t} > 0\}$ is *critical*

Topic-word statistics

$N_{w|t}$

Representations of $N_{w|t}$: arrays

```
int[] typeTopicCounts = new int[T];
```

Topics index array positions.

| | | | |
|---|---|---|---|
| 0 | 1 | 2 | 3 |
| 3 | 0 | 0 | 1 |

Most entries are zero.

Integer HashMaps

```
TIntIntHashMap typeTopicCounts =  
    new TIntIntHashMap();
```

Faster, but...

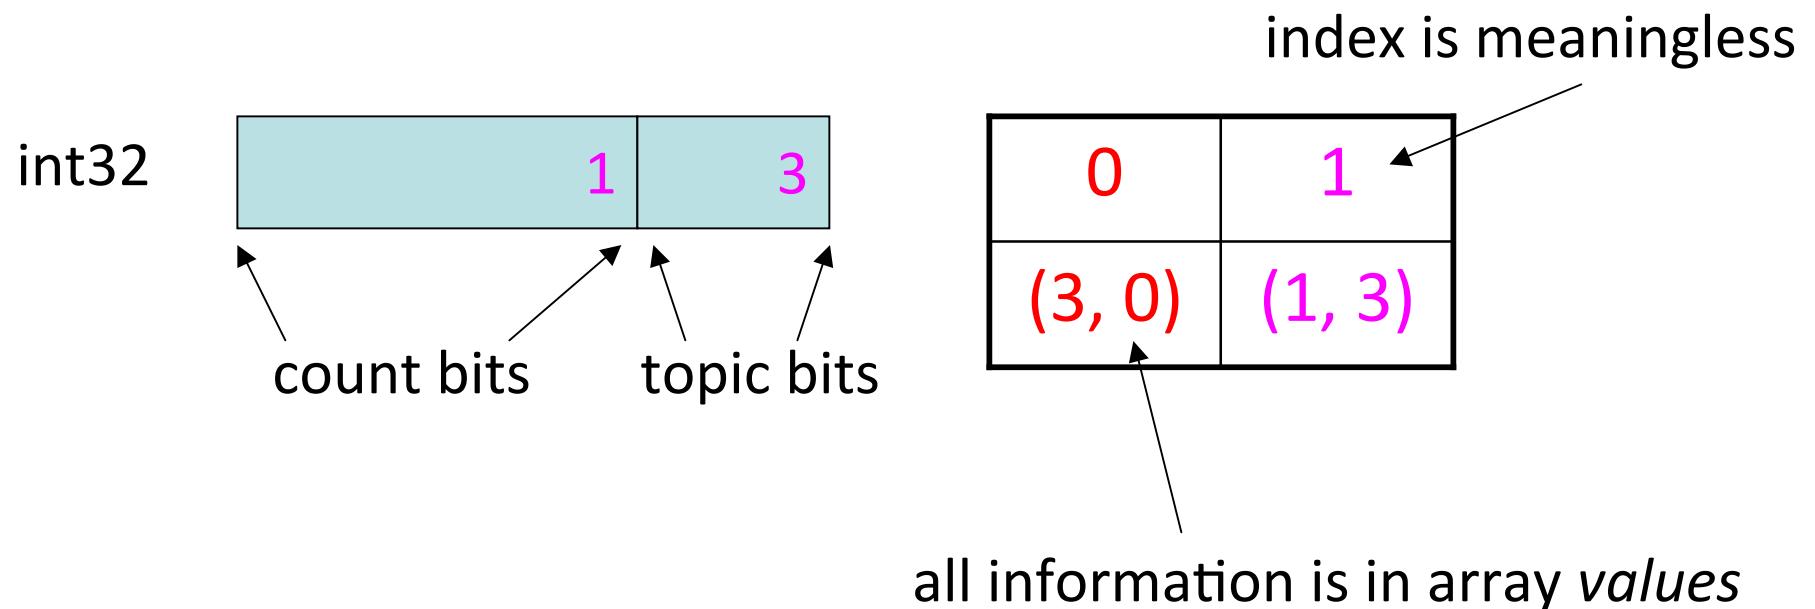

- Complicated
- Not much memory improvement
- Adds dependencies on external libraries (trove, fastutil).

| | |
|---|---|
| 0 | 3 |
| 3 | 1 |

↑
(giant black box)

Encoded integer arrays

```
int[] typeTopicCounts = new int[Nw]
```

Huge speedup, 2x faster than HashMaps

Example

| | | | | | | | | | |
|-------|-----|---|-----|----|-----|----|-----|----|-----|
| | ... | 8 | ... | 15 | ... | 83 | ... | 96 | ... |
| “dog” | 0 | 3 | 0 | 24 | 0 | 9 | 0 | 1 | 0 |

100 topics, so 4×100 bytes = 400

Example

| | | | | | | | | | |
|-------|-----|---|-----|----|-----|----|-----|----|-----|
| | ... | 8 | ... | 15 | ... | 83 | ... | 96 | ... |
| “dog” | 0 | 3 | 0 | 24 | 0 | 9 | 0 | 1 | 0 |

| | | | |
|----------|---------|--------|---------|
| 0 | 1 | 2 | 3 |
| (24, 15) | (9, 83) | (3, 8) | (1, 96) |

4 non-zero topics, 4×4 bytes = 16!

Example

| | | | | | | | | | |
|-------|-----|---|-----|----|-----|----|-----|----|-----|
| | ... | 8 | ... | 15 | ... | 83 | ... | 96 | ... |
| “dog” | 0 | 3 | 0 | 24 | 0 | 9 | 0 | 1 | 0 |

| | | | |
|-----------------|----------------|---------------|----------------|
| 0 | 1 | 2 | 3 |
| $24 \ll 7 + 15$ | $9 \ll 7 + 83$ | $3 \ll 7 + 8$ | $1 \ll 7 + 96$ |

100 topics, $2^7 > 100$

Basic Operations: iteration

| 0 | 1 | 2 | 3 |
|----------|---------|--------|---------|
| (24, 15) | (9, 83) | (3, 8) | (1, 96) |

$N_{w|83^{++}}$

Basic Operations: increment

| 0 | 1 | 2 | 3 |
|----------|---------|--------|---------|
| (24, 15) | (9, 83) | (3, 8) | (1, 96) |

v = (9+1)<<7 + 83

N_{w|83}++

Basic Operations: increment

| 0 | 1 | 2 | 3 |
|----------|----------|--------|---------|
| (24, 15) | (10, 83) | (3, 8) | (1, 96) |

v = (9+1)<<7 + 83

N_{w|83}++

Basic Operations: increment

| 0 | 1 | 2 | 3 |
|---------|---------|---------|---|
| (1, 15) | (1, 83) | (1, 96) | 0 |

v = (1+1)<<7 + 83

N_{w|83}++

Basic Operations: increment

| 0 | 1 | 2 | 3 |
|---------|---------|---------|---|
| (1, 15) | (1, 83) | (1, 96) | 0 |

v = (1+1)<<7 + 83

N_{w|83}++

Basic Operations: increment

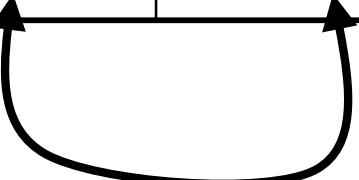

| | | | |
|---------|---------|---------|---|
| 0 | 1 | 2 | 3 |
| (1, 15) | (2, 83) | (1, 96) | 0 |

$N_{w|83^{++}}$

Basic Operations: increment

| 0 | 1 | 2 | 3 |
|---------|---------|---------|---|
| (2, 83) | (1, 15) | (1, 96) | 0 |

The diagram shows a 2D array with four columns. The top row contains indices 0, 1, 2, and 3. The bottom row contains values: (2, 83) at index 0, (1, 15) at index 1, (1, 96) at index 2, and 0 at index 3. Two curved arrows point from the bottom row to the top row, one at index 0 and one at index 1.

$N_{w|83}^{++}$

Basic Operations: decrement

| 0 | 1 | 2 | 3 |
|---------|---------|---------|---|
| (1, 15) | (1, 83) | (1, 96) | 0 |

$$v = (1-1) \ll 7 + 83$$

$N_w|83^{--}$

Basic Operations: decrement

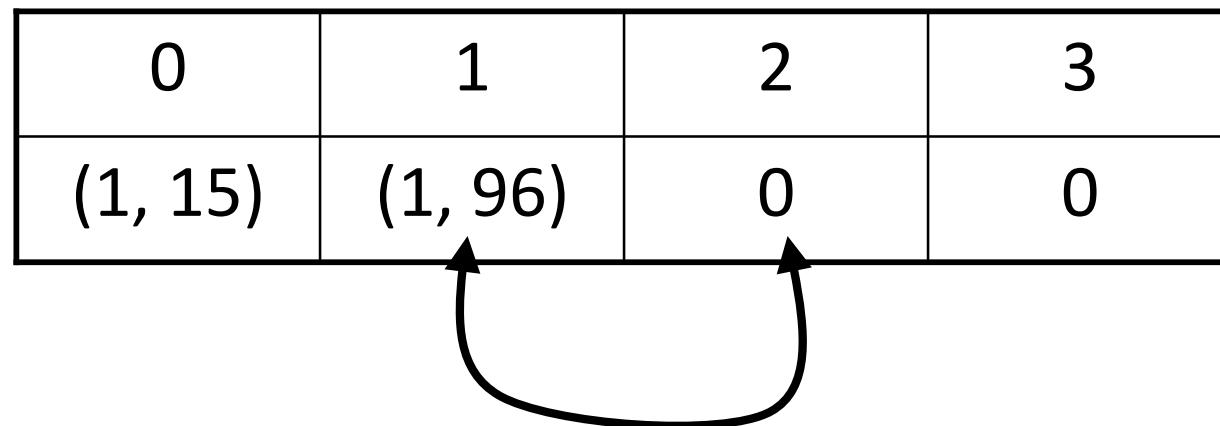

| 0 | 1 | 2 | 3 |
|---------|---|---------|---|
| (1, 15) | 0 | (1, 96) | 0 |

$$v = (1-1) \ll 7 + 83$$

$N_w|83^{--}$

Basic Operations: decrement

$N_w|83^{--}$

Basic Operations

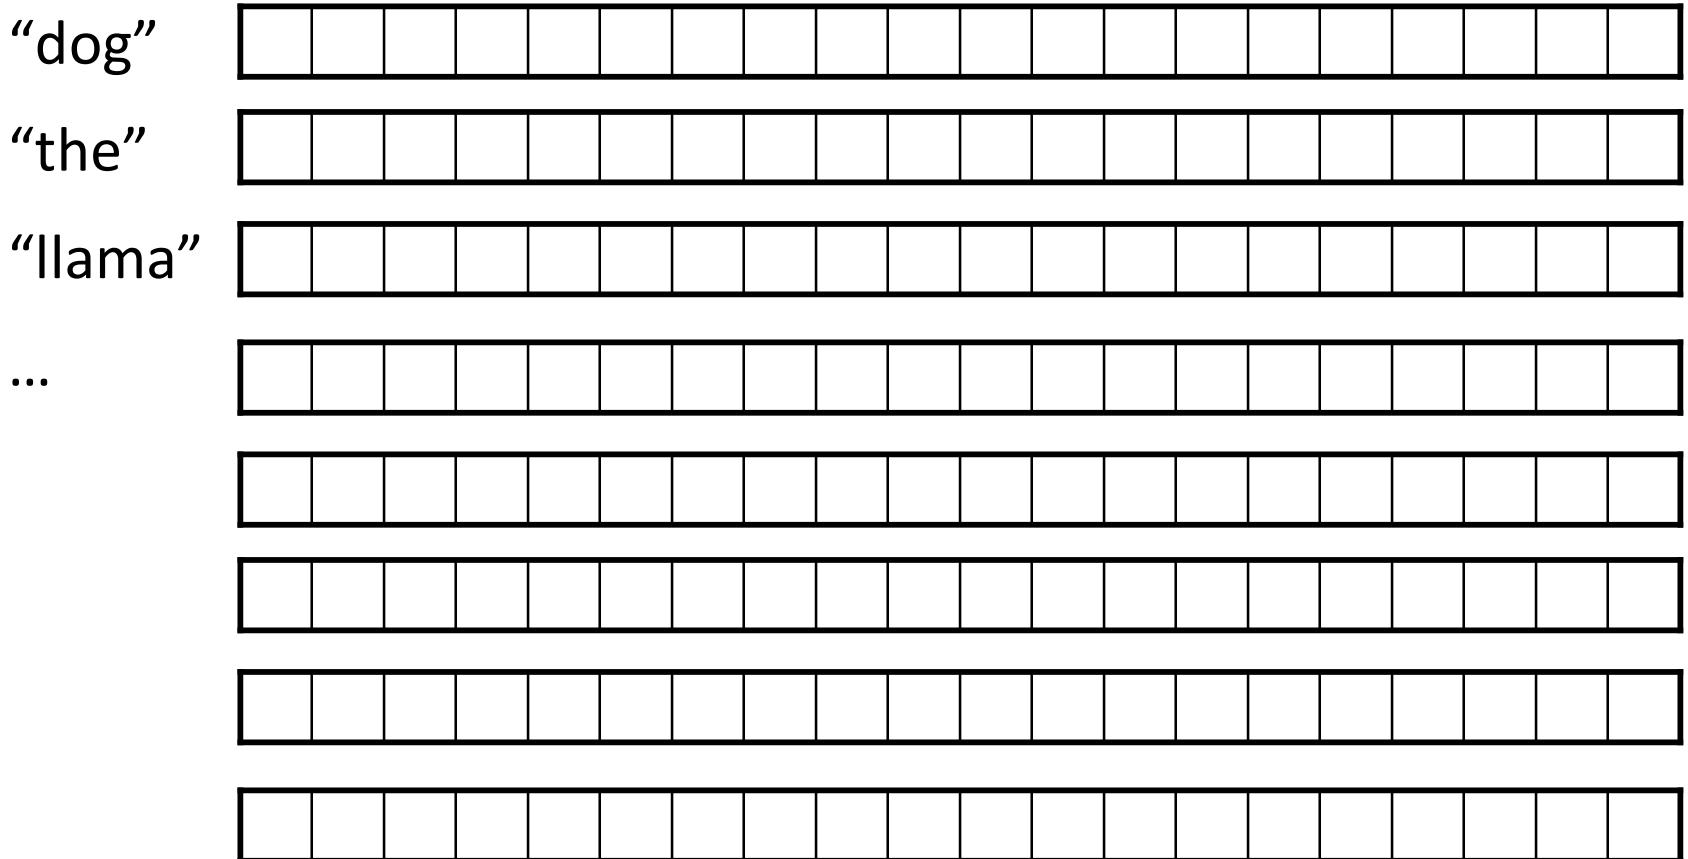

- Iterate:
 - linear in number of *non-zero* topics
- Increment and decrement:
 - theoretically the same as iterate, but usually constant

Memory allocation

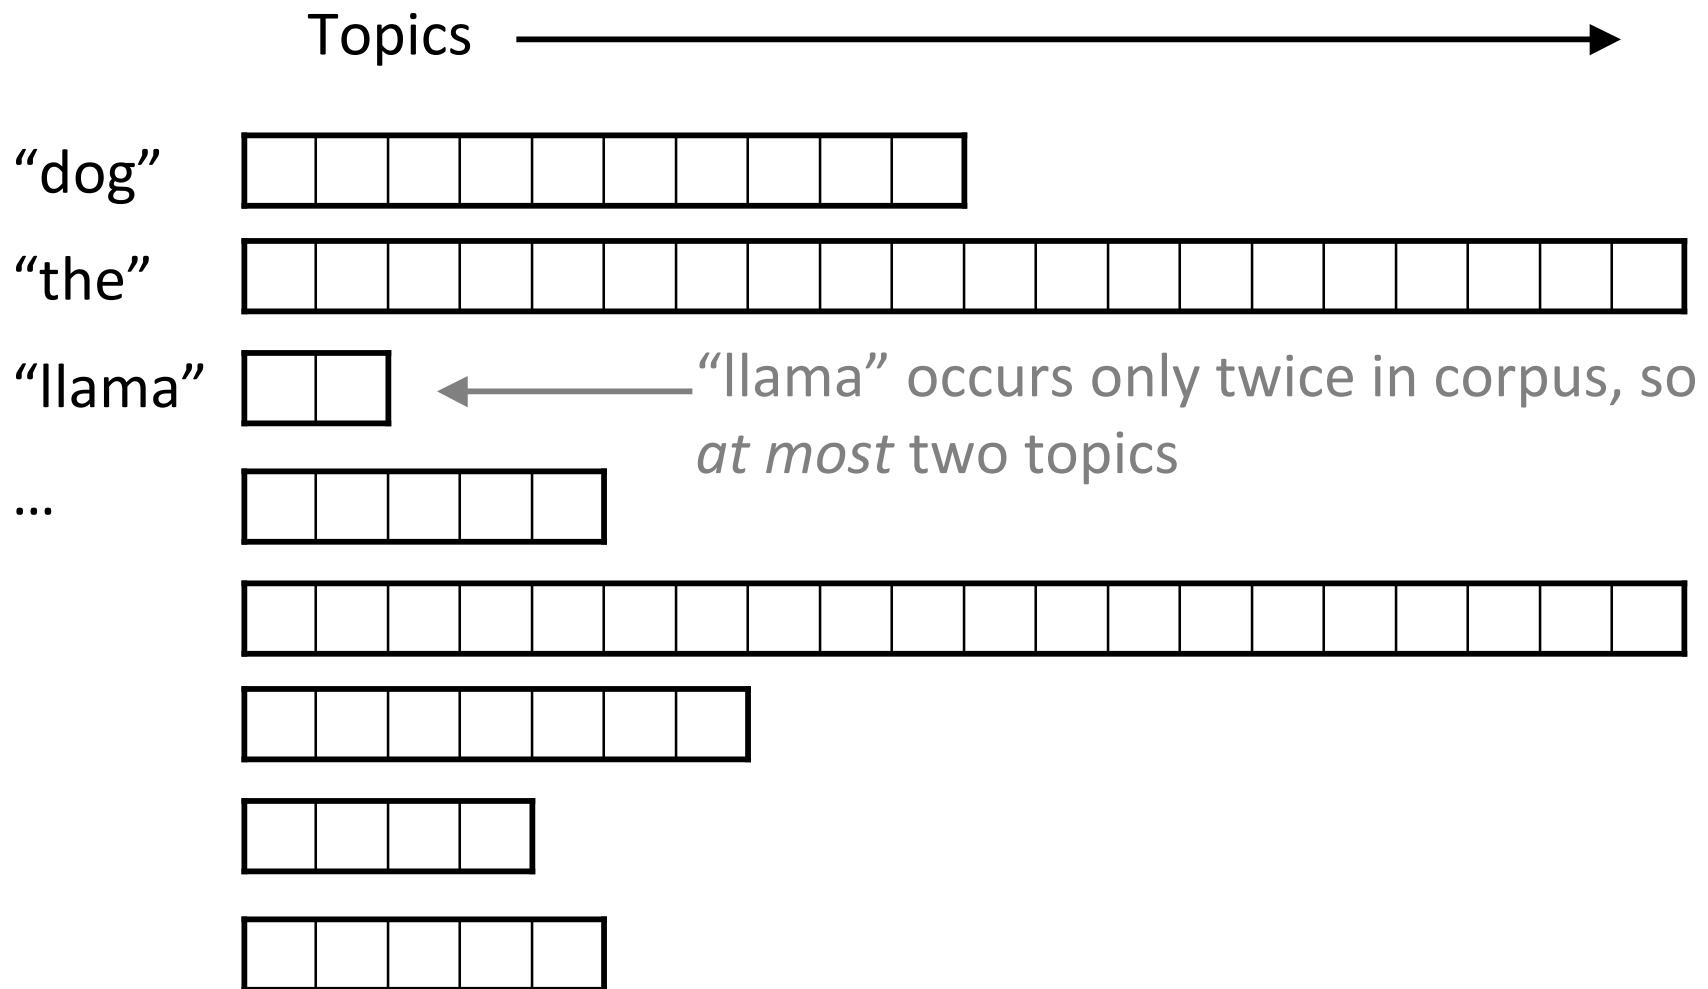

- Conservative:
 - Count total occurrences of each word type: N_w
 - For each word type, allocate $\text{int}[\min(T, N_w)]$
- More savings:
 - For each type allocate $\text{int}[\min(T, N_w)/k]$,
increase memory as needed (or not)

Standard allocation

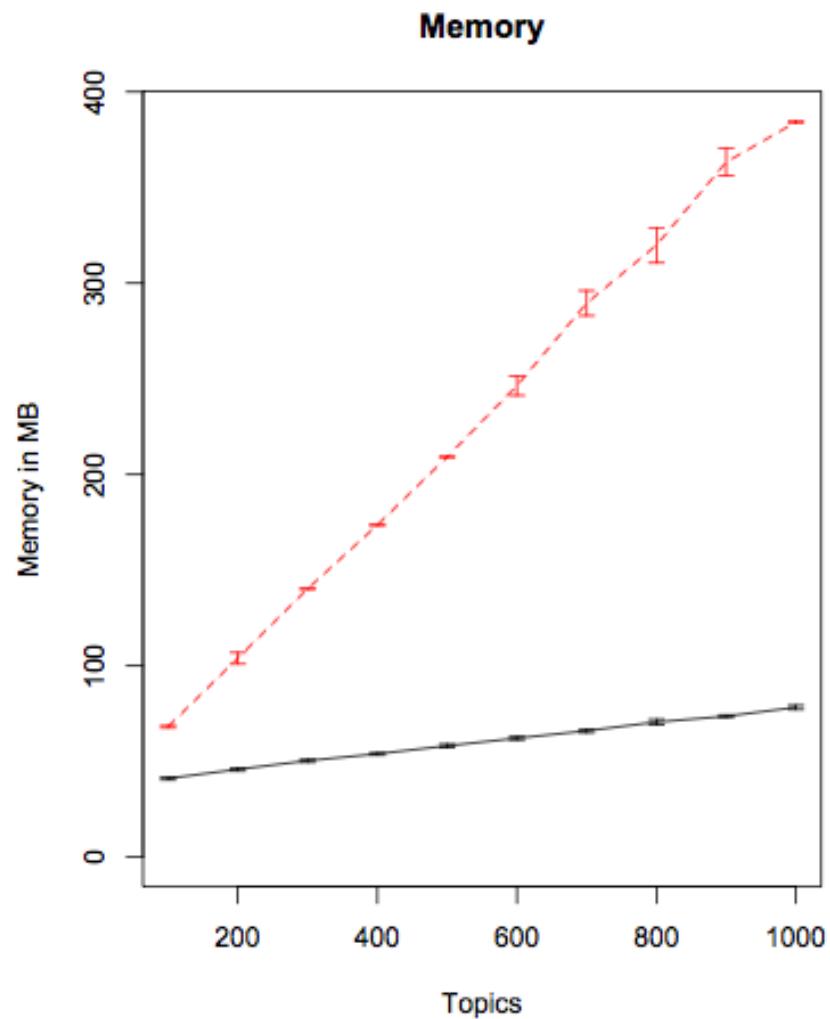

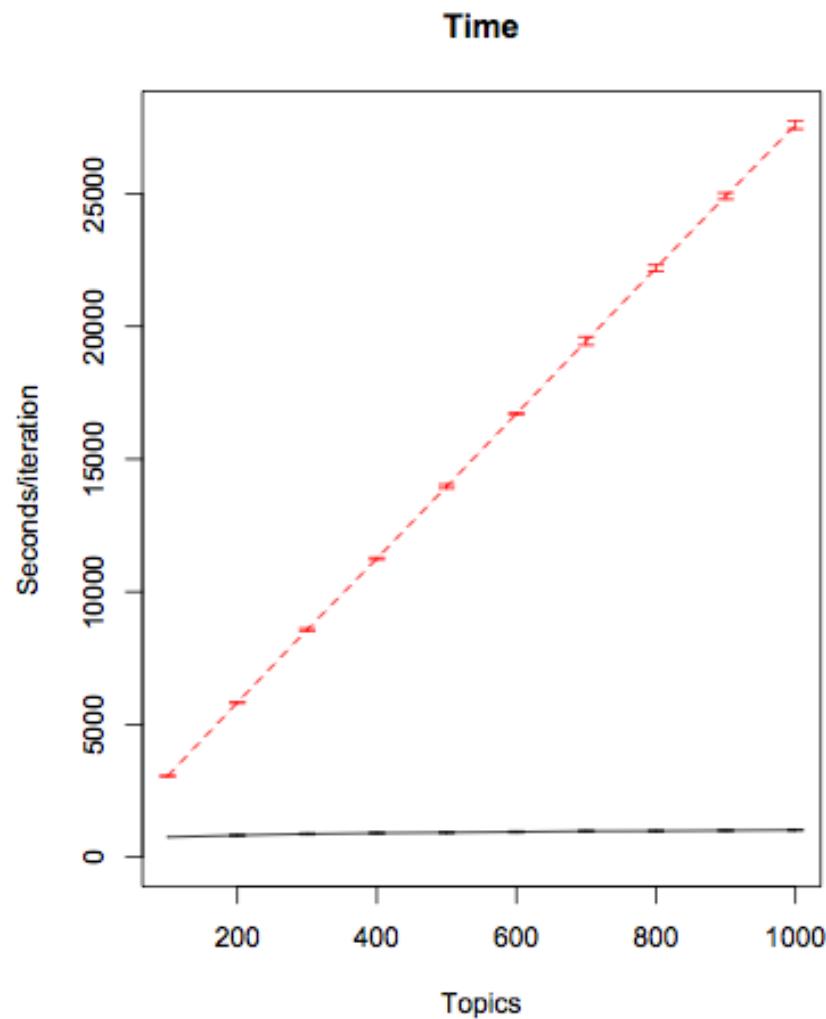

Topics

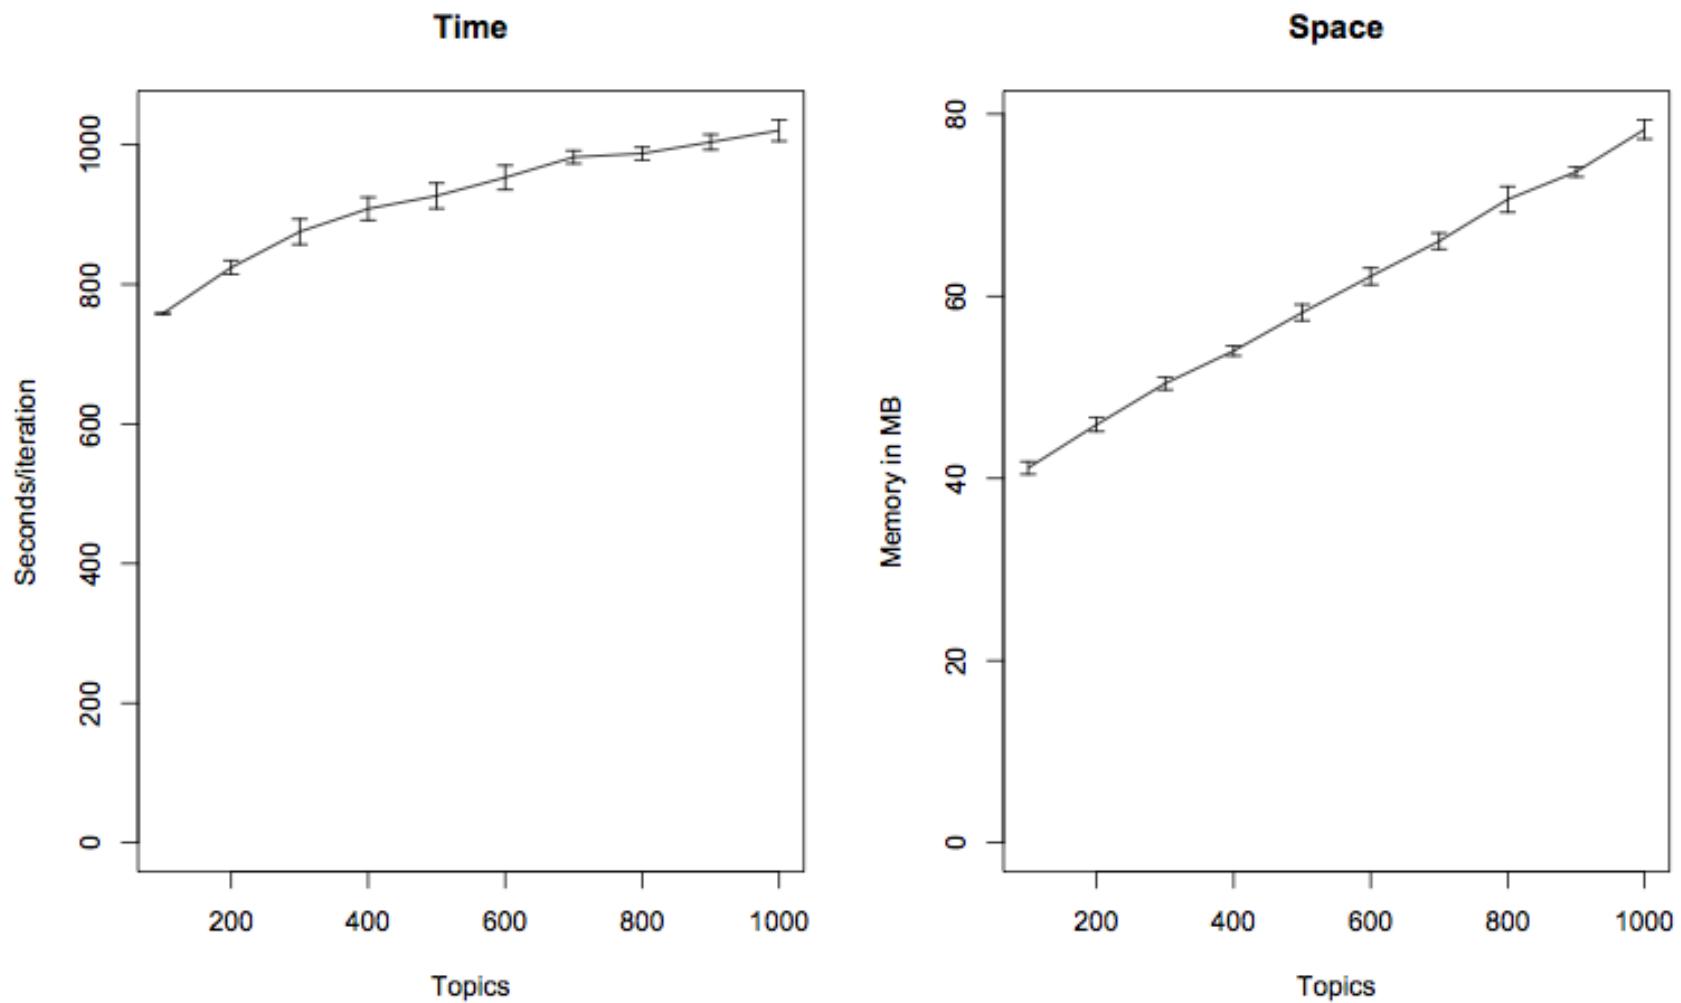

Conservative allocation

Huge savings: time and memory

Huge savings: time and memory

Large-scale Polylingual Topics

- Wikipedias in 40 languages (AR to ZH)
(Articles linking to same English page share $P(t|d)$)
- 1,200,000 *English* headwords
- 7,000,000 articles
- 300,000,000 tokens
- 4,000,000 distinct word types
 - Drop rare words (< 5 tokens)
 - Drop common words (> 5% of docs)
- 500 topics

One (1) CPU
